

Climate is the weather condition that a particular place has grown accustomed to for a long period of time. It is basically the weather condition that a place is known for, except that it is for a long duration of time (over 35 years).

Now, what is climate change? We must have all heard about this phenomenon from one source or another but have we really sat down, thought or made in depth research on this process and what it has been doing to affect our planet, continent, country, society and even us as each individual? Climate change is a gradual alteration of global or regional climate patterns.

Over the last century, scientists have reported a 1-degree Celsius rise in temperature of the earth, and it is estimated that at this pace, over the next century, the temperature of the earth would have risen by 1.5 – 2 degree Celsius. When most people see this values and estimates, their first thought is that why would such a small change affect me, but it is not so as this small change is what has had an impact on our beloved planet earth
