

Now that we have familiarized ourselves with climate change and what causes it, we need to know about what impact climate change has on our environment. Climate change is a phenomenon that has had and is still having a lot of impacts on our environment, these effects are numerous but we can only list a few;

Climate change has led to global food insecurity, the major provider of food globally, agriculture depends on climate, so what happens when climate is disturbed? What it does is that agriculture becomes unstable which leads to reduction of food in circulation which finally leads to malnutrition and a lower standard of living for farmers especially in Sub-Saharan Africa here most people depend on small scale farming to get their food for survival. This also leads to a lower standard of living as it represents major losses for farmers whose major source of income is agriculture.

Climate change also leads to a variety of diseases such as skin cancer and if we go on like this, it will come to a time where we have to wear sunscreen to go out during daytime as the intensity of the heat would be unbearable.

Climate change also leads to natural disasters such as flooding, tornadoes, etc which can lead to loss of lives and properties. All in all, the effect of climate change cannot be overemphasized and we cannot list them all but what we should be aware of is that climate change is something that can change life on earth for the worst and this is something we should all prevent.
